

STATUS OF CHILDHOOD IMMUNIZATION IN CALIFORNIA

This brief illustrates the current status of childhood immunization in California and is intended to inform state-level policy decisions and priorities. Takeaways include:

- State-level immunization coverage in California for MMR vaccination is above national levels.
- California does not allow personal or religious exemptions.
- State-level per capita public health spending is higher than the national rate.
- California has reported 20 cases of measles since January 1, 2025.

VACCINATION COVERAGE

Maintaining sufficient vaccination coverage is critical for establishing community protection. The charts below demonstrate how coverage for two critical vaccines has changed over time in California and how it compares to neighboring states, national rates, and Healthy People 2030 (HP2030) targets.

Proportion of 2-year-olds fully protected with DTaP vaccines

In 2023, fewer 2-year-olds were fully vaccinated against diphtheria, tetanus, and pertussis (received all four doses of DTaP) in California compared to the previous year. Coverage in California is below the HP2030 target of 90%.

Proportion of kindergartners protected with MMR vaccines

In 2024, approximately the same proportion of kindergartners completed the measles, mumps, and rubella (MMR) vaccine series in California compared to the previous year. Coverage in California exceeds the HP2030 target of 95%.

VACCINATION EXEMPTIONS

Many states allow children attending public school to receive vaccination exemptions for religious reasons or for personal reasons, sometimes referred to as “philosophical exemptions.” Higher rates of non-medical exemptions have been linked with increased disease transmission.

Allows personal exemptions?	Allows religious exemptions?	Non-medical exemptions — state	Non-medical exemptions — US median
NO	NO	NA	4%

Additional details on exemption requirements:

California removed its personal and religious exemption option in 2015.

PUBLIC HEALTH SPENDING

Low levels of public health spending are thought to contribute to suboptimal immunization rates. Nationally, California ranks 9th in public health spending.

UNIVERSAL VACCINE PURCHASING

In states with Universal Purchase programs, the state government purchases all recommended vaccines for all children, regardless of insurance status. These initiatives can help to address disparities in vaccine coverage and support equitable vaccine access.

SUPPORT FOR IMMUNIZATION

Strong policy commitment to immunization is critical for effective vaccination programs. The state legislature has recently introduced several bills that would affect state-wide childhood vaccination, a selection of which are described below. The arrows below indicate whether these bills would strengthen (↑) or weaken (↓) vaccine safety nets.

-  CA SB 290 (Not enacted) – Repeals the requirement that children must be immunized in order to receive CalWORKs benefits
-  CA AB 2101 (Not enacted) – Establishes a state stockpile of vaccines
-  CA SB 957 (Not enacted) – Establishes the inclusion of sexual orientation and gender identity data within the State Immunization Information System (IIS)
-  CA SB 144 (Not enacted) – Would authorize state to modify or supplement baseline vaccine recommendations, taking into account guidance from leading medical organizations

DISEASE STATUS

Measles outbreaks can indicate insufficient vaccination coverage within a population. Disease may spread across state borders when vaccine coverage is low. The map below visualizes the number of measles cases reported in California and neighboring states between January 1, 2025 and September 15, 2025.

Source: U.S. Measles Tracker, IVAC.

Vaccines can help prevent expensive disease outbreaks. A 2018–19 measles outbreak in Washington was estimated to cost **US\$47,479** per case for both direct medical and public health response expenses.
